

Digital Signatures Cycle

An advanced, secure solution that provides order and review of business documents and enables full control of signatures and approvals – from anywhere. The DocCycle Digital Signatures Cycle was developed especially for organizations that use advanced ERP information systems and need to manage signatures for several people.

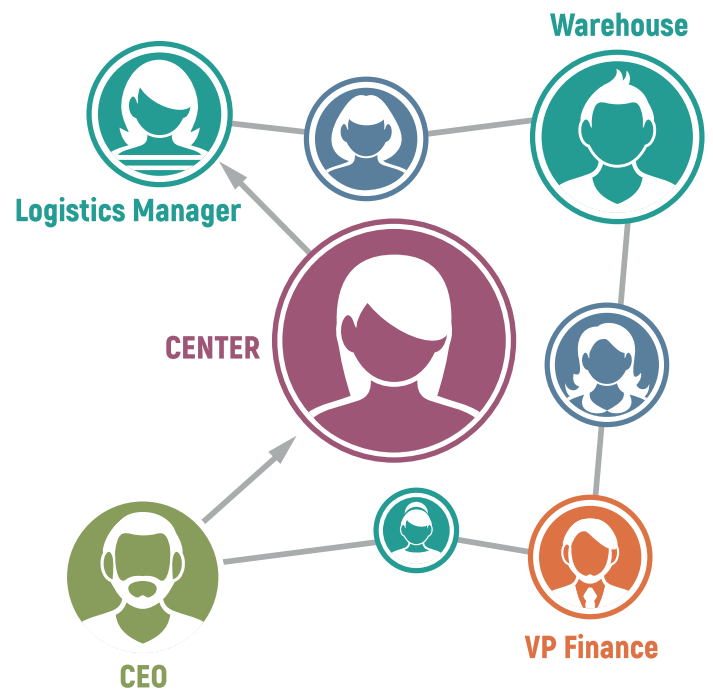

Full control of document signature processes

The signing process is defined by the document center when a document is scanned into the system. Each team member is informed that the signing process has begun and can view the document's progress from a screen showing all the documents awaiting their signature.

Signers can also add their name, amount, free text, and comments to the document fields. Signers can also reject approval of the document and add their own comments, if the conditions for signing have not been met.

At the end of the cycle, the approved document returns to the center and from there is entered in the management system into the screen of that document's attachments. The system allows control and viewing permissions to be granted, so management can monitor and manage signatures quickly and transparently. All employees have full access to their own account and can manage their signatures from any computer, tablet, or smartphone.

Full compatibility with all leading ERP software on the market!

Digital Signatures Cycle

Leading features

Cloud Service

Enables access from any device at any time with a username and password. The software operates on desktop computers through all browsers as well as on Android and IOS, and interfaces with all the leading information systems (ERP) on the market.

Strict Data Security

The software disconnects automatically after a few minutes of inactivity. Each document is signed with a hologram signature (signature sample) and with an approved digital signature.

Organization and Order

Each document is managed by one (or more) Centers with full control and transparency over the signing processes. If a document gets "stuck" at one of the signers, a specific reminder can be sent to speed up handling.

Full, Close Monitoring

Each action of signing or adding data to a document is time-stamped, so that the entire process is monitored from start to finish.
